

SEO Audit — HNAK.com

Prepared: 5 June 2026 **Domain audited:** <https://www.hnak.com> (primary locale: `/en-sa` , `/ar-sa`) **Market:** Kingdom of Saudi Arabia (KSA), with GCC delivery **Business:** General-merchandise e-commerce store — the online arm of **Al Musbah Global Trading** (Al Musbah Group), a major KSA retail group with 190+ physical stores. Catalogue spans mobiles & electronics, home & kitchen appliances, fashion & shoes, perfumes, and more, from 3,000+ brands.

Scope & method note: This audit is based on publicly available information (search results, app-store listings, review platforms, market reports) plus standard technical-SEO inspection. The live site returned **HTTP 403 Forbidden** to automated fetching during this audit — itself a finding (see §2.1). Items marked **[VERIFY]** must be confirmed with direct access to the site, Google Search Console (GSC), Google Analytics 4 (GA4), and a crawler (Screaming Frog / Sitebulb) before being treated as conclusive. Treat this as a prioritized framework, not a final crawl report.

1. Executive Summary

HNAK competes in one of the most contested e-commerce markets in the region — KSA digital retail is a ~\$30B+ market dominated by **Amazon.sa, Noon, Jarir, and eXtra**. As a horizontal marketplace without the brand equity or backlink authority of those giants, HNAK's realistic SEO opportunity is in the **mid- and long-tail**: specific product, brand, model, and category queries (e.g., "iPhone 15 price Saudi Arabia", "سعر آيفون في السعودية") plus localized intent ("free delivery Jeddah", "cash on delivery KSA").

Top priorities (next 90 days):

#	Issue	Impact	Effort
1	403 to crawlers / bot-management blocking — risk of blocking Googlebot/Bingbot or rendering	🔴 Critical	Low–Med
2	Bilingual hreflang (en-sa / ar-sa) correctness — Arabic is the larger search audience	🔴 Critical	Med
3	Faceted-navigation crawl bloat & thin/duplicate category pages	🟡 High	Med
4	Product & category on-page optimization (titles, meta, H1, unique copy, schema)	🟡 High	High (scale)
5	Core Web Vitals / mobile performance — KSA is mobile-first	🟡 High	Med–High
6	Structured data (Product, Offer, AggregateRating, BreadcrumbList, Organization)	🟡 Medium	Med
7	Backlink authority & brand SERP vs. competitors	🟡 Medium	Ongoing

2. Technical SEO

2.1 Crawlability & Indexation 🔴

- **403 Forbidden to non-browser clients.** During this audit every automated request (homepage, `/en-sa` , `/robots.txt`) returned **403**. This is typically a CDN/WAF/bot-management rule (Cloudflare, Akamai, Imperva, etc.). **Risk:** if the rule is over-aggressive, it can block or throttle **Googlebot, Bingbot, and third-party SEO crawlers**, and break **mobile rendering / JS execution** that Google needs.
- **Action:** Verify in GSC → **URL Inspection** → **Test Live URL** that Googlebot can fetch and render key templates (home, category, product). Confirm Googlebot/Bingbot IP ranges and verified user-agents are **allow-listed** at the WAF. **[VERIFY]**

- **robots.txt** — could not be retrieved (403). Confirm it exists, is reachable at `https://www.hnak.com/robots.txt`, returns 200, references the XML sitemap(s), and does **not** disallow JS/CSS or important category paths. **[VERIFY]**
- **XML sitemaps** — Confirm presence of segmented sitemaps (categories, products, brands, content) split into <50k-URL / <50MB files, with a sitemap index. Submit all to GSC and Bing Webmaster Tools. Keep them auto-updated and free of non-200, noindex, or redirected URLs. **[VERIFY]**
- **Index bloat / coverage** — Pull GSC **Pages (Indexing)** report. Watch for "Crawled – currently not indexed" and "Discovered – currently not indexed" (signals of thin/duplicate pages or crawl-budget waste). **[VERIFY]**

2.2 Faceted Navigation & Duplicate Content ●

E-commerce sites bleed crawl budget through filter/sort URL parameters (`?color=` , `?sort=` , `?page=` , price ranges). Likely issues on a large catalogue like HNAK's: - Infinite parameter combinations creating near-duplicate URLs. - Sort/view params producing identical content under different URLs. - **Actions:** - Set a **self-referencing canonical** on every category page; point filtered/sorted variants to the clean canonical where content is substantially duplicate. - Decide a deliberate policy: index a small set of **high-demand facets** (e.g., brand within category — "Samsung mobiles") and `noindex, follow` or block the rest. - Use `rel="next/prev"` is deprecated — instead ensure paginated pages are crawlable with unique self-canonicals (do **not** canonical page 2+ to page 1). - Configure crawl rules for low-value parameters; keep `robots.txt` disallow for pure tracking params.

2.3 URL Structure & Internationalization ●

- URLs follow a clean locale pattern: `/en-sa/...` (and presumably `/ar-sa/...`). Good foundation.
- **hreflang is the single most important i18n task.** Arabic-speaking search demand in KSA is large and often under-served. Each page must declare reciprocal annotations: `<html <link rel="alternate" hreflang="ar-sa" href="https://www.hnak.com/ar-sa/..." /> <link rel="alternate" hreflang="en-sa" href="https://www.hnak.com/en-sa/..." /> <link rel="alternate" hreflang="x-default" href="https://www.hnak.com/..." />`
- **Validate:** return tags are reciprocal, use correct ISO codes (`ar-sa` , `en-sa`), and that each alternate URL returns 200 (not redirect/404). **[VERIFY]**
- Ensure Arabic pages render proper **RTL** layout, Arabic `<title> /meta/H1` (not machine-translated boilerplate), and Arabic URL slugs or transliteration handled consistently.
- Confirm canonicals point **within the same locale** (`ar` → `ar` , `en` → `en`), never cross-locale.
- Enforce one canonical host (`www` vs non- `www`) and **HTTPS everywhere** with 301s, no redirect chains. **[VERIFY]**

2.4 Core Web Vitals & Mobile ●

KSA traffic is overwhelmingly **mobile**; HNAK also pushes iOS/Android apps. The mobile web experience must be fast. - Run **PageSpeed Insights / CrUX** on home, a category, and a product page for both field (real-user) and lab data. Target: **LCP < 2.5s, INP < 200ms, CLS < 0.1**. **[VERIFY]** - Common e-comm wins: compress/serve **WebP/AVIF** images with explicit width/height (avoid CLS), lazy-load below-the-fold media, defer non-critical JS, preconnect to CDN, cache aggressively, and minimize third-party tags (chat, analytics, ads, A/B tools). - Confirm **mobile-friendly** (responsive, tap targets, no intrusive interstitials beyond a compliant app banner).

2.5 Other technical checks **[VERIFY]**

- HTTP status hygiene: minimize soft-404s on out-of-stock/discontinued products; return proper 404/410 or 301 to relevant category.
 - Out-of-stock strategy: keep indexable with "notify me"/related items rather than deleting, to preserve link equity and rankings.
 - Custom 404 page that links back into the catalogue.
 - Secure headers, no mixed content, valid SSL chain.
 - Check for accidental `noindex` on staging-style or filtered templates.
-

3. On-Page SEO

3.1 Title Tags & Meta Descriptions

At catalogue scale, use **templated, dynamic** patterns with guardrails against duplication: - **Category:** {Category} – Buy Online in Saudi Arabia | Best Prices | HNAK - **Product:** {Brand} {Product Name} {Key Spec} | Price in KSA | HNAK - Keep titles ≤ ~60 chars (account for Arabic width), descriptions ≤ ~155 chars, each unique, with primary keyword front-loaded and a value hook (free delivery, Mada/Tamara, COD). **[VERIFY current state]**

3.2 Headings & Content

- Exactly **one H1** per page reflecting the primary entity (category/product name).
- Category pages need **unique intro/footer copy** (50–150 words) targeting the head term + buying intent, not duplicated across categories.
- Product pages need **unique descriptions** (avoid pasting manufacturer copy verbatim across the web), key specs in a structured table, and genuine **user reviews/Q&A** (great for long-tail + fresh UGC).
- Add SEO-supporting modules: "Popular {Category} brands", related/comparison links, and an FAQ block (price, warranty, delivery, COD) — feeds FAQ rich results and voice search.

3.3 Internal Linking & Architecture

- Keep a **flat, logical hierarchy**: Home → Category → Subcategory → Product (≤3–4 clicks).
- Implement **BreadcrumbList** navigation (UX + breadcrumb rich result).
- Cross-link related products, "frequently bought together", and brand hubs. Build **brand landing pages** (e.g., /brands/samsung) as authority/internal-link hubs.
- Ensure primary nav links are crawlable HTML anchors, not JS-only click handlers.

3.4 Images

- Descriptive **alt** text (localized per language), keyword-relevant filenames, and an **image sitemap** to win Google Images / Shopping surfaces.

4. Structured Data (Schema.org)

High-impact for e-commerce rich results. Implement valid JSON-LD and test in the **Rich Results Test**: - **Product** + **Offer** (price, priceCurrency: SAR , availability, condition) → price & availability in SERP. - **AggregateRating / Review** where genuine reviews exist → star ratings (do not fake/mark up non-existent reviews — policy violation). - **BreadcrumbList** on all category/product pages. - **Organization** (logo, sameAs to social/app listings, contact) on home. - **WebSite** with **SiteNavigation / Sitelinks Search Box** potential. - **FAQPage** on category/help pages where applicable. - Mark up in the page's language; keep markup consistent with visible content.

5. Content & Keyword Strategy

Positioning: Don't fight Amazon/Noon for raw head terms you can't outrank on authority. Win **specific, localized, transactional long-tail** and Arabic queries.

- **Keyword research** (per locale, EN + AR): map clusters around category + KSA/Saudi , brand + model + price , سعر , شراء + المنتج + السعودية , plus local modifiers (Jeddah, Makkah, Riyadh, COD, Tamara installments, Mada). Map each cluster to a target page; fix keyword cannibalization. **[VERIFY with GSC + keyword tool]**

- **Buying guides / blog hub** (EN & AR): "Best budget phones in Saudi Arabia 2026", "How to pay with Tamara", seasonal guides (Ramadan, White Friday, back-to-school). Builds topical authority, top-funnel traffic, and internal links to category pages.
- **Seasonal/landing pages** for KSA retail peaks (White Friday, Ramadan, National Day, Eid) — create early, keep evergreen URLs year over year rather than deleting.
- Surface **trust/value props** (free delivery > SAR 200, COD, Mada/Visa/Mastercard, Tamara BNPL, 190+ stores, returns) prominently — improves CTR and conversions.

6. Off-Page / Authority 🟡

- **Backlink gap [VERIFY]:** benchmark referring domains vs. Noon/Jarir/eXtra using Ahrefs/Semrich. Expect a large gap; prioritize realistic local links:
- KSA news/PR, deal & coupon sites (already present, e.g., AlCoupon), price-comparison platforms (Pricena), business directories, brand/supplier co-marketing.
- Digital PR around Al Musbah Group's offline footprint (190+ stores) — a differentiator competitors can't easily copy.
- **Brand SERP / reputation:** Trustpilot, Scamadviser, and app-store reviews are mixed. Actively manage reviews (respond, resolve), claim/optimize the **Google Business Profile(s)** for physical stores (local pack + "near me"), and ensure a clean branded SERP (Knowledge Panel via Organization schema + Wikidata/social consistency).
- **App ↔ web synergy:** the iOS/Android apps are an asset — ensure web → app deep links, app-indexing where relevant, and consistent NAP/brand signals.

7. Analytics, Measurement & Governance 🟢

Before/while fixing, make sure you can measure: - **GSC** (separate properties or filters for `en-sa` vs `ar-sa`), **Bing Webmaster Tools**, **GA4** with e-commerce events, and a crawler (Screaming Frog/Sitebulb) on a recurring schedule. - Track: organic sessions & revenue by locale, indexed-page count, CWV pass rate, rankings for priority clusters, and crawl-error/coverage trends. - Set up **log-file analysis** to see how Googlebot actually crawls (and to confirm it isn't being 403'd).

8. Prioritized Roadmap

Phase 1 — Foundations & Crawl Health (Weeks 1–4) 1. Confirm Googlebot/Bingbot are not blocked by the 403/WAF rule; test live rendering in GSC. 🟢 2. Verify robots.txt + submit segmented XML sitemaps. 🟢 3. Audit & fix hreflang (`en-sa` ↔ `ar-sa`) reciprocity and canonicals. 🟢 4. Set up/clean GSC, Bing WMT, GA4 e-comm, and a baseline crawl. 🟢

Phase 2 — Indexation Quality & On-Page (Weeks 4–10) 5. Faceted-nav canonical/noindex policy; kill index bloat. 🟡 6. Templated unique titles/meta/H1 across category & product at scale. 🟡 7. Unique category intro copy + product description guidelines. 🟡 8. Roll out Product/Offer/Breadcrumb/Organization schema. 🟡

Phase 3 — Performance & Growth (Weeks 8–16+) 9. Core Web Vitals / mobile speed program. 🟡 10. Arabic + English keyword mapping; fix cannibalization. 🟡 11. Launch buying-guide content hub + seasonal landing pages. 🟡 12. Local SEO (GBP for stores) + link-building & review management. 🟡

9. Key Open Items to Verify with Direct Access

Because the live site blocked automated inspection, confirm the following with browser/GSC/crawler access before finalizing: - [] Does Googlebot receive 200 (not 403) and fully render JS? (log files + GSC live test) - [] robots.txt contents and sitemap

references - [] Current title/meta/H1 patterns and duplication rate - [] hreflang reciprocity and canonical correctness across locales - [] Faceted-URL indexation footprint in GSC - [] Core Web Vitals field data (CrUX) per template - [] Existing structured data coverage and validity - [] Indexed page count vs. catalogue size; coverage errors - [] Backlink profile vs. competitors
